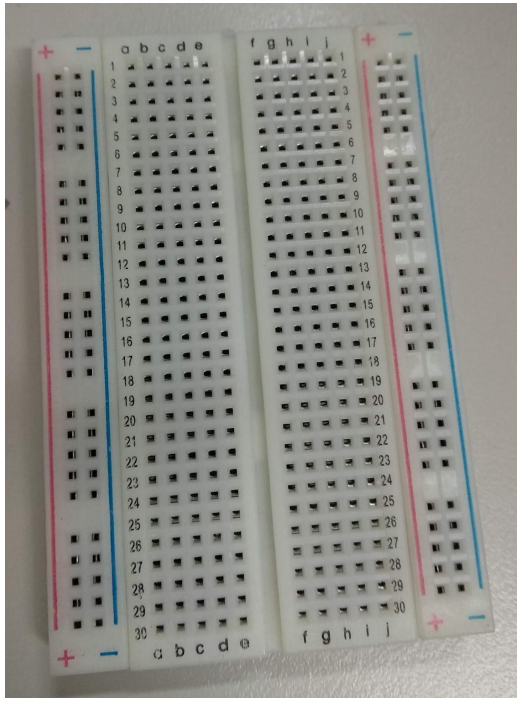
MPSL2018

Lab4-GPIO

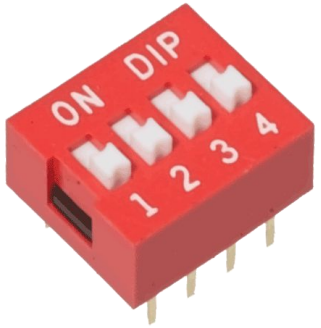
Components of lab

- Breadboard
- 4DIP Switch
- 1K Ω Network Resistor *1
- LED *4
- 220 Ω resistor *4

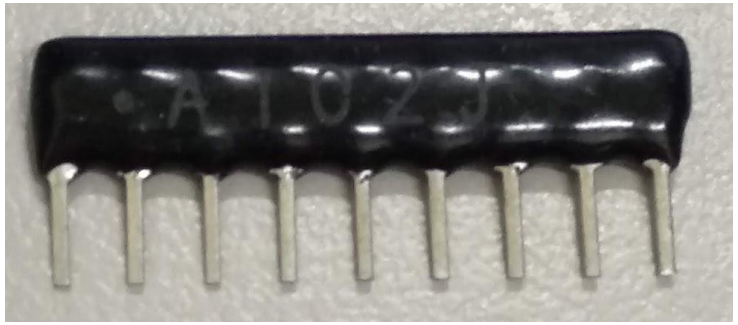
Breadboard



4 DIP Switch

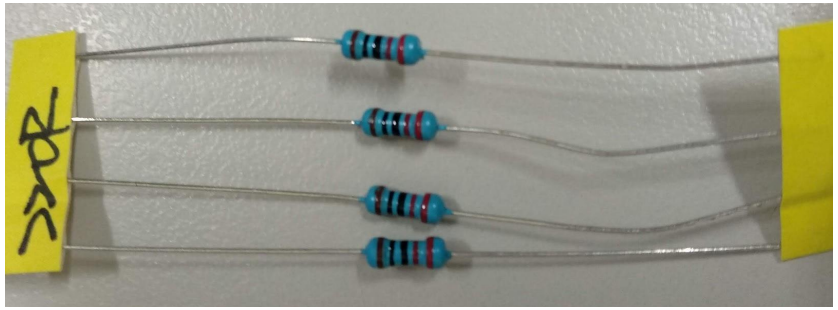


1k Ω Network resistor



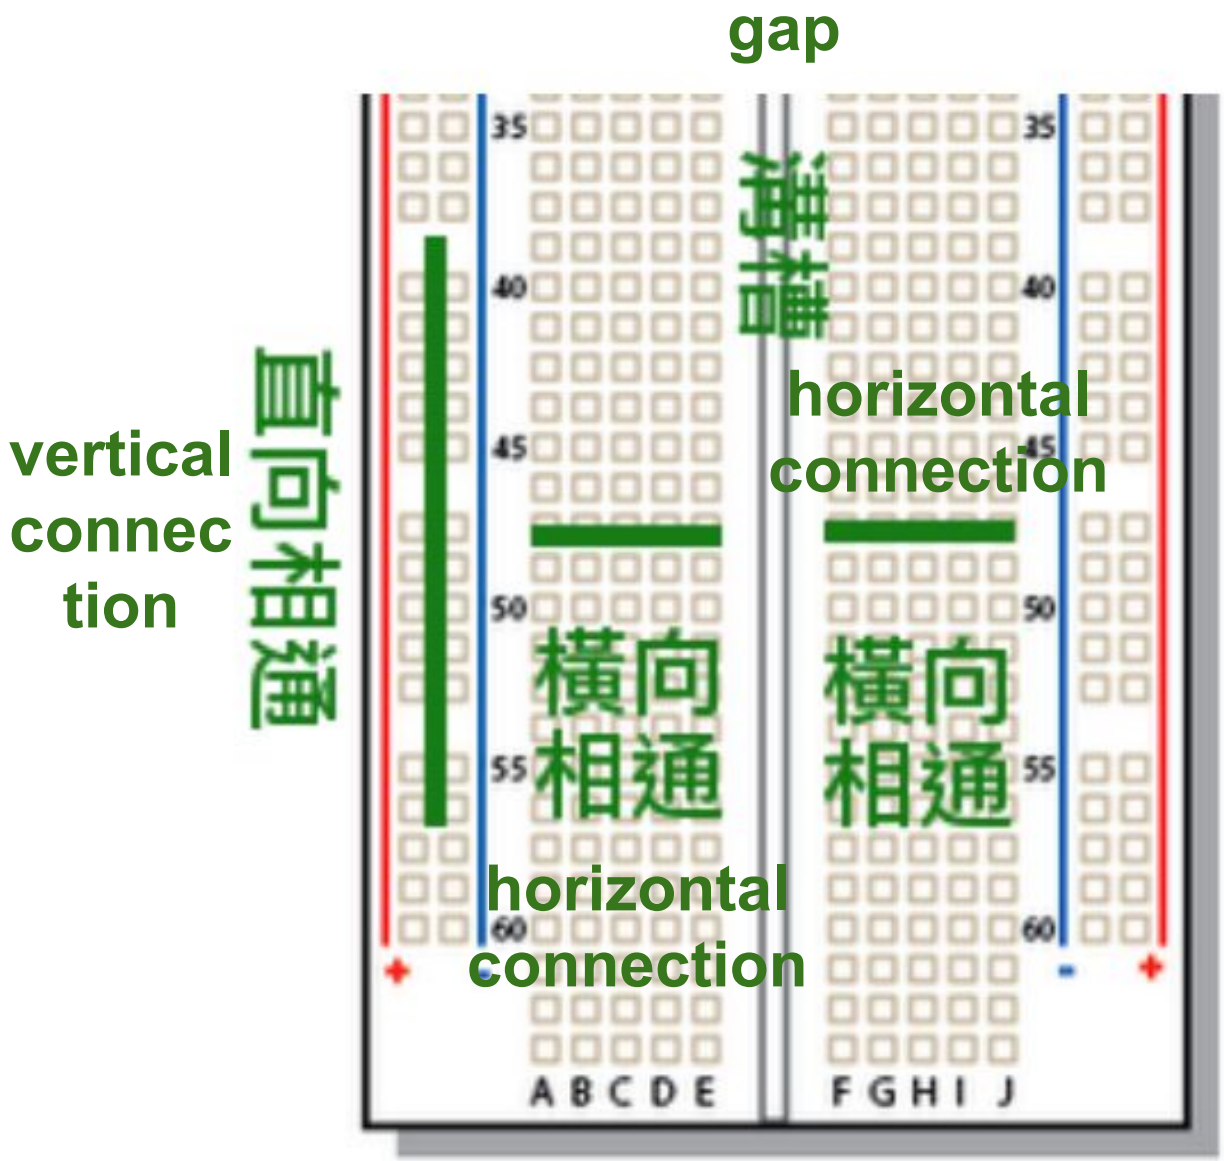
LED * 4

220 Ω resistor *4



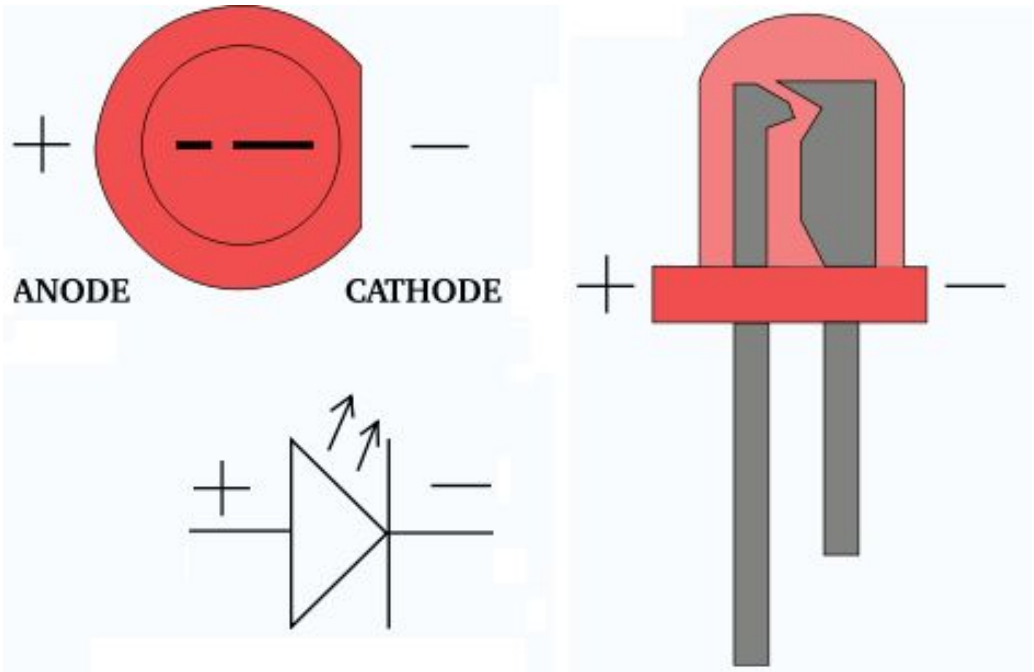
Breadboard

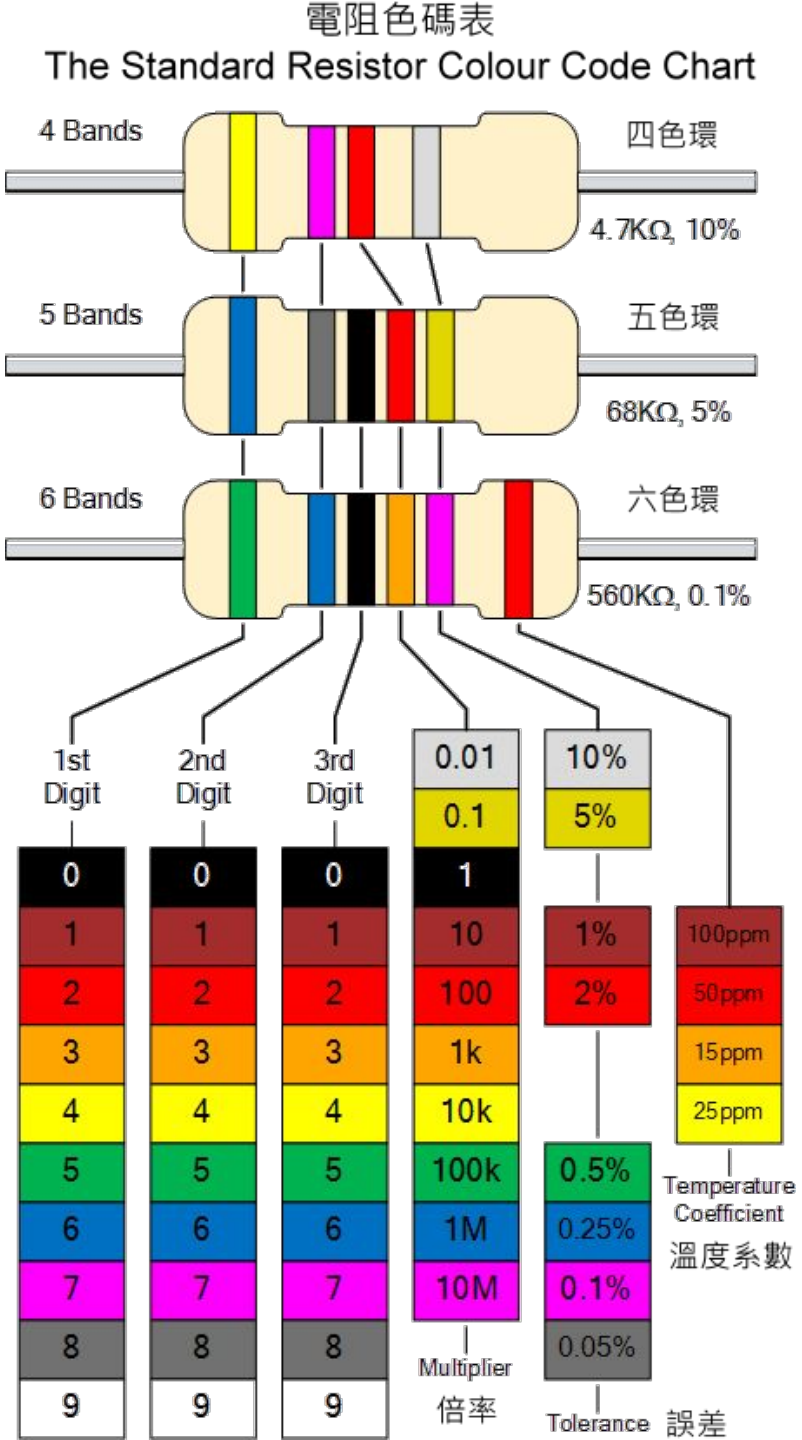
- Easy to connect electronic components
- Please be careful when plugging and unplugging



Resistor and LED

- mark resistor value by colour code
- the long pin of LED is positive (+)

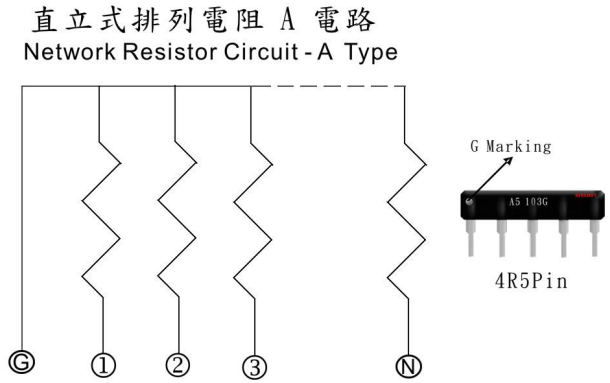




Network resistor 排列電阻

- many resistors in it
- mark resistor value by number, e.g : 102=10*10^2 = 1K Ω

network resistor naming			
circuit type	number of pins	resistor value	difference
• A : all resistors share one pin (leftmost) • B : each resistor has its own independent pin • ...	4 ~ 14	three-digital first and second digital are valid number and third digital is number of zero after valid number	• F : ±1% • G : ±2% • J : ±5%



Our network resistor name is "A 102 J" , it is no number of pins.
But we can count it and know number of pins is nine.

Negative logic and Positive logic

- logic can mean to the logical level received by the CPU when a component "action" or "trigger"
- Positive logic or Active High
  - When component actions, CPU receives High level ("1")
- Negative logic or Active Low
  - When component actions, CPU receives Low level ("0")

e.g.
